

Non-puerperal uterine inversion –a case report

Ashraf Ganjoei T. (M.D.).

Assistant Professor, Obs and Gyn Department, Faculty of Medicine, Kerman Medical Sciences University, Kerman, Iran.

Abstract

Inversion of the uterus is a rare clinical problem. It is encountered as an obstetric emergency and a diagnostic challenge in gynecology. Non-puerperal inversion usually results from a tumor implanted on fundus of the uterus. Treatment depends on the associated pathology and the stage.

A rare case of non-puerperal uterine inversion caused by a large fundal leiomyoma was reported in Bahonar Hospital, Kerman, in a 38 years old woman resulting in severe lower abdominal pain and profuse vaginal bleeding. After incomplete myomectomy, reduce the inversion vaginally was successful and abdominal hysterectomy was performed.

Keywords: Uterine inversion, Non-puerperal and Case report.
